

SAVEETHA SCHOOL OF ENGINEERING
CSA 15- CLOUD COMPUTING AND BIG DATA ANALYTICS
LIST OF EXPERIMENT 13

13. Demonstrate Infrastructure as a Service (IaaS) by creating a resources group using a Public Cloud Service Provider (Azure), configure with minimum CPU, RAM, and Storage.

Aim

To demonstrate **Infrastructure as a Service (IaaS)** by creating a **Resource Group** and deploying a **Virtual Machine** using Microsoft Azure as the public cloud service provider, configured with minimum CPU, RAM, and storage resources.

Procedure

1. Sign in to the **Microsoft Azure Portal** using an Azure account.
2. Select **Virtual Machines** and click **Create** → **Azure Virtual Machine**.
3. Select the **Azure for Students** subscription.
4. Create a new **Resource Group** and provide a suitable name such as CSA15-Cloud-RG.
5. Enter a suitable **Virtual Machine name**, such as CSA15-VM1.
6. Select a nearby Azure region, such as **Central India**, and choose an available availability zone.
7. Select a **Windows Server** image and choose the **x64** architecture.
8. Select a minimum suitable VM size, such as **Standard_B2as_v2**, with **2 vCPUs and 8 GiB RAM**, depending on subscription availability.
9. Configure the administrator username and password for accessing the VM.
10. Under **Inbound port rules**, allow **RDP (3389)** for remote access to the Windows VM.
11. Configure the required **OS disk/storage** with the minimum suitable storage option.
12. Review all the configurations and click **Create** to deploy the virtual machine.
13. After deployment, connect to the VM using the downloaded **RDP file**.
14. Verify that the virtual machine is running successfully in the Azure Portal.

Result

Thus, **Infrastructure as a Service (IaaS)** was successfully demonstrated using **Microsoft Azure**. A Resource Group and Windows Virtual Machine were created and configured with the minimum required CPU, RAM, and storage resources. The deployed VM was successfully accessed through **Remote Desktop Protocol (RDP)**.
