

SAVEETHA SCHOOL OF ENGINEERING
CSA 15- CLOUD COMPUTING AND BIG DATA ANALYTICS LIST
OF EXPERIMENT 17

17. Host a Simple Web Application

Aim

To create a simple web application using Java/Python and host it on a public cloud service provider to demonstrate Platform as a Service (PaaS).

Procedure

1. Log in to the AWS Management Console.
2. Create a new application/project in the selected cloud platform.
3. Select a suitable application hosting service that supports Java or Python.
4. Create a simple web application using Java or Python.
5. Add the required HTML and application files to display the web page.
6. Install the required libraries and dependencies for the application.
7. Test the application locally and verify that it runs correctly.
8. Configure the application runtime and required environment variables.
9. Package the application according to the requirements of the cloud platform.
10. Upload or deploy the application to the cloud service.
11. Wait for the deployment process to complete successfully.
12. Start the deployed application and check its status.
13. Obtain the public URL provided by the cloud platform.
14. Open the URL in a web browser and verify that the application is accessible.
15. Test the application and check the cloud logs for any errors.

Result

The web application was successfully created, deployed and hosted on a public cloud platform. The application was accessed through its public URL, demonstrating PaaS.
