

SAVEETHA SCHOOL OF ENGINEERING

CSA 15- CLOUD COMPUTING AND BIG DATA ANALYTICS LIST

OF EXPERIMENT 20

20. Demonstrate Database as a Service

Aim

To demonstrate Database as a Service (DaaS) by creating and configuring a managed database using a public cloud service provider.

Procedure

1. Log in to the AWS Management Console.
2. Navigate to the Amazon RDS service.
3. Select Create Database to create a new managed database.
4. Choose a database engine such as MySQL.
5. Select the required database version and deployment option.
6. Configure the database instance with suitable CPU, memory and storage.
7. Enter the database identifier, username and password.
8. Configure the required network, VPC and subnet settings.
9. Create or select a security group and allow the required database port.
10. Review the database configuration and click Create Database.
11. Wait until the database status changes to Available.
12. Copy the database endpoint and port provided by AWS.
13. Connect to the database using a suitable database client or MySQL command-line tool.
14. Create a sample table and perform basic SQL operations such as inserting and retrieving records.
15. Verify that the database is functioning correctly and disconnect after completing the experiment.

Result

A managed database was successfully created and configured using Amazon RDS. The database was accessed through its endpoint and basic SQL operations were performed successfully, demonstrating Database as a Service (DaaS).
